All Your Vaccine Questions **ANSWERED**

INTRODUCTION

Most of us have spent our entire lives hearing the same story about vaccines. We are told that thanks to vaccines, deadly diseases have been eradicated and millions of lives have been saved. We are warned that if we stop vaccinating, the diseases will come back with a vengeance. Instead of receiving an accurate picture of vaccine effectiveness and risks, we receive an oversimplified yet frightening portrayal of disease dangers, while the risk of vaccine-injury or death is written off as "one in a million".

From our research (and for some of us, from personal experience) many more than one in a million lives have been ruined by vaccines. We don't want any more people to be hurt needlessly. We encourage you to explore both sides, and make an educated decision.

DO YOU KNOW WHAT'S IN A VACCINE?

HUMAN AND ANIMAL CELLS

Human cells from aborted fetuses and human albumin; pig blood, horse blood, rabbit brain, guinea pig, dog kidney, cow heart, monkey kidney, chicken embryo, chicken egg, duck egg, calf serum, sheep's blood and more.

AMMONIUM SULFATE

Suspected gastrointestinal, liver, nerve, and respiratory system poison.

BETA-PROPIOLACTONE

Known to cause cancer, suspected gastrointestinal, liver, skin, and sense organ poison.

ANIMAL, BACTERIAL, AND VIRAL DNA

Can be incorporated into the recipient's DNA and cause unknown genetic mutation.

MONOSODIUM GLUTAMATE (MSG)

A neurotoxin. Being studied for mutagenic, teratogenicity (fetal malformation), and reproductive effects. Can create mild to severe allergic reactions. Probable carcinogen: suspected in causing cancer of the liver, nervous, gastrointestinal, reproductive, respiratory, and immune systems. Linked to leukemia, brain, colon, and lymphatic cancer.

POLYSORBATE 80

Known to cause cancer in animals.

FORMALDEHYDE (FORMALIN)

Major constituent of embalming fluid; poisonous if ingested. Probable carcinogen (cancer causing): suspected in gastrointestinal, liver, immune system, nerve system, reproductive system, and respiratory system. Poison. Linked to leukemia, brain, colon, and lymphatic cancer.

MICRO-ORGANISMS (OFTEN UNDETECTED)

Live and killed viruses and bacteria or their toxins. Millions of doses of

polio vaccine were contaminated with monkey virus (SV-40), now turning up in human bone, lung lining (mesothelioma), brain tumors and lymphomas.

GELATIN

Produced from selected pieces of calf and cattle skin, demineralized cattle bones, and pork skin. Severe allergic reactions have been reported.

ALUMINUM

Implicated as a cause of brain damage. Suspected factor in Alzheimer's disease, dementia, seizures, and comas. Allergic reaction can occur on skin.

GENTAMICIN SULFATE AND POLYMYXIN B (ANTIBIOTICS)

Allergic reactions can range from mild to life threatening.

GLUTARALDEHYDE

Poisonous if ingested. Causes Birth defects in experimental animals.

MERCURY (THIMEROSAL)

The second-most-toxic element on Earth (after Plutonium). Has an affinity to the brain, gut, liver, bone marrow, and kidneys. Minute amounts can cause brain/nerve damage. Symptoms of mercury toxicity are similar to those of autism.

TRI(N) BUTYLPHOSPHATE

Suspected kidney and nerve poison.

NEOMYCIN SULFATE (ANTIBIOTICS)

Interferes with B6 absorption. A deficit in the uptake of B6 can cause a rare form of Epilepsy and mental retardation. Allergic reactions can range from mild to life threatening.

PHENOL/PHENOXYETHANOL (2-PE)

Used in antifreeze; toxic to all cells and capable of disabling the immune system's primary response mechanism.

The following interview with Mr. Moshe K. was reprinted from the Tachlis Publication.

As one of the people involved in the inner work of the PEACH organization, he gives us the inside scoop.

How did you get involved with P.E.A.C.H.?

My position on vaccination precedes my involvement with PEACH. Almost 40 years ago, when I was growing up in London, England, an upscale pediatrician told my parents, "cut down sugar and cut out the vaccines; they can damage the brain". So my parents stopped vaccinating. It was no big deal when the 3 of us had mumps at once; we had fun and skipped school for a few days. We visited our classmates who had the measles and they visited us.

After marrying, I compromised somewhat and we delayed and skipped some vaccines at first. Until as a bookworm, I came across more information that made me stop until I could do more research and be sure we were making the right decision. That was many years ago. When others began to get organized about sharing the information on vaccine-dangers with fellow-yidden, I knew I had to contribute in any way I could, even if just to save one life.

What do you believe about vaccines today?

Ibelieve that people should do more homework. The reality is that we've been misinformed about the real effects of vaccines. They are much more dangerous than most people realize. I also think that our understanding of vaccine-preventable-diseases is not accurate. Vaccines are taking credit for something they have not done. In all reality vaccination worsened our health and increased death rates.

What's your proof that vaccines are dangerous?

Firstly, just ask any of the hundreds of thousands of parents whose children's lives were ruined within hours of vaccines. I personally know many of them.

But secondly, the studies don't show the potential for harm because they're not designed well enough to do so. They leave us without any way to be sure they are safe. However, there is plenty of evidence that vaccines cause harm. This is all retroactive- meaning, we are learning about the vaccine risks after they have been approved for public consumption. They are hurting many of their recipients. Since the 1990's, The U.S. tax funded "vaccine courts" have paid out over 3 billion dollars to vaccine-damaged families. A disability and death tax was enacted for vaccines because U.S. congress and vaccine manufacturers admit that vaccines are, "Unavoidably unsafe." They know children will be harmed. Most vaccine

package inserts (in section 13) state that they have never been tested for causing cancer, genetic defects, or infertility.

I thought vaccine reactions were less than one in a million.

Apparently not. The U.S. government's VAERS (Vaccine Adverse Events Reporting System) receives about 30,000 reports of adverse reactions every year. 3,000-4,500 are labeled as severe. The FDA admits that the reported incidents may account for at most 10% of the actual number of adverse events each year, so you'll have to multiply the reported incidents by at least 10 to get to the real number. Whatever that number is, it's much more than 1 in a million.

Then there is the real-life experience of seeing children develop seizures, go into anaphylactic shock, high pitched screaming- (which is a sign of painful and potentially disabling brain inflammation), terrible croupy cough, asthma, brain damage, paralysis and even infant death shortly after vaccination. You don't have to be a detective to pick up on the cause-and-effect. In fact, I think the damage that vaccines have done would be obvious to everyone if the medical media had not succeeded in completely obscuring the obvious repercussions of vaccines, so we no longer see the cause and effect.

Aren't vaccines and the vaccine schedule studied for many years with extreme scientific scrutiny?

Not quite. Safety studies are almost always very short; less than three weeks! This is obviously, an insufficient time frame, since vaccine damage can be prolonged, and the onset may be delayed. Also, they often test a new vaccine by using an existing vaccine as the placebo, instead of using something inert like saline. When the new vaccine causes as many reactions as the old one, they can report that it had no more side-effects than the placebo! This is totally misleading- they didn't test the vaccine against a placebo.

Without proper safety testing, we have no assurance that vaccines are safe. The CDC says that it would be "impractical" to do long term safety studies, and "unethical" to withhold vaccines while long term studies are being done. But if they haven't tested vaccines for their long-term consequences, then how can we be sure we want them? We have no way to know the risks if they don't test for them.

Well, even if vaccines have risks, don't you believe that they're worth it because they prevent dangerous diseases?

Some vaccines work, some don't. Measles, mumps, rubella, chicken pox- do work for many people. But I still don't think they're worth taking because these vaccines cause worse problems than the mild diseases they may prevent.

Even vaccines that actually work, only provide temporary immunity. That's why they give boosters. According to a Harvard study, mumps creates an antibody which protects the ovaries. And while ovarian cancer kills 1% of middle-aged women, it's extremely rare among women who have had childhood mumps!

Isn't measles a really dangerous disease? Didn't it kill thousands of people before the vaccine was introduced?

It's amazing how this fabrication has become so widespread. Measles was in reality a harmless disease before the vaccine came around. It's only dangerous in poor malnourished children, who could also die because of nutritional deficiency from something as mild as a cold. Vaccines are killing a lot of children in impoverished countries, even today.

About measles, in the U.S., in the years before the introduction of the measles vaccine, there were around 1-3 deaths per state. In some states there were no deaths at all. Numbers like that are not equated with deadly diseases. It's misleading that they make it sound scarier than it really is. It's true that it's very contagious, but that doesn't mean it's dangerous. The MMR vaccine, meanwhile, is dangerous. It causes meningitis, brain damage, autism, cancer and many serious diseases.

Let's back up a moment, here. Hasn't the link between autism and vaccines been disproven already?

The Institute of Medicine voted that a "causal link could not be established", but the vote was cast by ignoring evidence. It's ironic that science isn't always so scientific. It's possible to pick and choose which studies and statistics you want to include in the final conclusions. The IOM recommended that no more research should be done into the vaccine-autism link. But, why would they want to prevent further research? It's completely unscientific.

We've heard that the leader of the anti-vaccination movement (Dr. Andrew Wakefield) has been debunked and his study was retracted. Why would you follow this lone voice of dissent, especially after he was clearly proven wrong and stripped of his medical license?

There are so many misconceptions in that question, but I don't blame you. It is sadly indicative of how greatly the vaccine industry has distorted reality. Dr. Wakefield was never the leader of the anti-vaccine movement. He was simply one of many thousands of people who've found a link between autism and vaccines. It's tragic that speaking out cost him his medical license, but he didn't deserve the infamy he received.

They made an example of him so other doctors would think twice before expressing concerns about vaccines. I have heard him speak, and you can see that the only

thing that matters to him is the truth and children's health. He is a very intelligent and scrupulous person. His unwillingness to back down from what he knew to be the truth is what cost him his medical license. (You can listen to Dr. Wakefield on the hotline 212-444-1900 ext 6-4-1 lecture #51)

People have accused anti-vaxxers of confusing the public with their unfounded beliefs about vaccines and autism.

When you watch a child go from healthy to autistic before your very eyes, sometimes within hours or days of vaccination, and they tell you: "vaccines don't cause autism! Ignore what your eyes see, disregard your suspicions. Uneducated emotional parents are always looking to find someone to blame..." Intelligent and inquisitive minds cannot be turned off so easily. Why would people's personal experiences and observations confuse people? To the watchful observer, it's actually quite obvious that vaccines cause autism, and too many other health problems.

I don't understand how they have managed to cover this one up for so long. The CDC and FDA know the truth, but just imagine what would happen if they admitted that vaccines cause autism. They can't. They've dug themselves in too deep. If they admitted that vaccines cause autism, they would be taking responsibility for destroying literally millions of lives. They can't do that. For them, there's no going back.

That sounds like a bit of an exaggeration.

It isn't. The evidence is clear. They've (the CDC/ FDA) known since at least 2004 that vaccines cause autism. The lead author of that IOM report I just told you about, which closed the issue on vaccines and autism, was senior CDC scientist, Dr. William Thompson. Well, he recently filed for whistleblower protection when he decided to reveal the evidence they've been hiding from us since 2004.

They purposely suppressed data. They even destroyed evidence from their studies to cover up the autism link, because their studies made it very obvious that vaccines were causing neurodevelopmental delays. Thompson made copies of everything before it was destroyed. They're still waiting for a congressional hearing, but the request has been ignored. This is public information. Anyone can look it up, if they don't believe it.

Perhaps I should... A lot of people have accused you PEACH people of being biased and one-sided. Don't you think you'd be more credible if you presented the other side too?

I'm not afraid for people to read literature that promotes vaccines, we encourage you to. But I'm not going to go so far as to print their lies as if it's truth. I've spent many years researching vaccines, and I've come to the conclusion that vaccines

are dangerous and that we've been misled. I believe the public is starving for this information! People who are blindly pro-vax are afraid to read our research. If they're so certain of the truth, what do they have to lose? We encourage everybody to read both sides and make an educated decision. What makes the pro-vaccine parties suspect is that they want you to have no faith in your own judgment and obey them blindly. You do the math.

Medical school is rigorous. Do you claim to know more about vaccines than doctors?

Medical school may be rigorous, but if you read medical school textbooks you'll see that their vaccine education is very simplified. It's important to remember that doctors aren't scientists or researchers. It is not their job to investigate vaccine safety. Their job is to give the mandated vaccines to their patients. They are usually unfamiliar with the ingredients and side-effects of vaccines, beyond what they were told.

Some doctors are unaware that vaccines can cause severe reactions altogether. Even when kids have reactions listed in the vaccine inserts, The doctors often deny the connection. Do they even read the package inserts? Even according to the vaccine manufacturers, seizures after vaccines are very common. If it becomes epilepsy, they say the child had an underlying condition, rather than face the truth – that the vaccine caused the epilepsy.

And yes, I do claim to know more about vaccines than most pediatricians. I've spent years actively researching this subject. You don't have to go to medical school to obtain a brain. Baruch Hashem, we're all granted one for free!

Perhaps a good way to present both sides fairly would be by arranging a public debate. I'm sure the other side has very strong arguments to defend their position!

We would love to have a public debate. I've been trying to arrange one for years – but no one is willing to take us up on our offer. If doctors have such strong proof about the safety and effectiveness of vaccines, you'd think that they would be willing to stand up in civil discussion. My guess is that because their real education of vaccines is so oversimplified, most doctors are not equipped to defend their positions when faced with the real evidence that we have gathered. They just don't want to face us on an even playing field. However, there is a debate of this nature on the PEACH hotline if you'd like to hear it; its lecture 14 and it's pretty unbelievable. (212-444-1900 ext 6-4-1)

Doctors are respected pillars of our community. Do you believe they are misleading the public and convincing them of something they know to be false? Are you accusing them of lying?

No, I don't think they're lying. I think they believe what they're espousing. Doctors might be very virtuous and caring, but that doesn't make them correct. No matter how much chessed they do, they should never be obeyed blindly. Only Hashem deserves that kind of trust. I don't think they're intentionally misleading the public. They believe what they've been taught, its part of their training.

They just get all their information from the same source- the medical authorities and the vaccine manufacturers. They're not allowed to question or they'll get penalized. They would lose their medical license. It has already happened to doctors, time and again. It's easier in the short run, to just go with the flow. It's a difficult position to be in and I don't envy them. Nevertheless, for a doctor to blindly follow the medical authorities without question is still wrong. Endangering the lives of children through dubious medical practices cannot be justified.

Many doctors claim to have done a lot of research into vaccines. I find this hard to believe, because if they really did the research, then it would lead them to the real mitziyus, that vaccines are harming children. Could a frum, yarei shamayim really know the whole truth about vaccines and still administer them? It just doesn't seem possible. The only way to explain how a caring doctor could endanger his patients is that he's doing it so unwittingly.

I've heard that vaccine non-compliance is most common among uneducated people. And that once people get informed, they will of course choose to vaccinate.

Propaganda-wise, that's a smart line to employ; no one wants to be perceived as "uneducated." But in fact, the exact opposite is true. The majority of people in affluent countries who are rejecting vaccines today are highly educated. The pharmaceutical industry actually knows this, and they wrote about it in the World Health Organization's "Best Practice Guidance: How to respond to vocal vaccine deniers in public." In this book, geared to respond to those as they see as a threat to their profitability, (page 12), they write about individuals who refuse to vaccinate, and admit "some of whom are very highly educated individuals."

They recognize whom they're up against, but they know how to employ psychological warfare, by convincing the public that those who don't vaccinate are ignorant. It's a tool to keep others from wanting to fall into that camp.

Their goal seems to be to prevent people from trusting themselves, but in truth, most people who've stopped vaccinating have done a lot of research. Those who are on the fence should do more research until they own the information. Don't allow yourself to be scared or insulted into obeying them. I have a lot of faith

in parents. If they follow their instincts and use their brains, they will choose to protect their children, not endanger them.

You said earlier that you believe some vaccines work. Why would you reject all of them?

The vaccines that work are more dangerous than the diseases they prevent. This is true for MMR and chicken pox. Most of the others don't work. At all. DTaP causes pertussis- it doesn't prevent it. It doesn't work. And it's a really reactive vaccine.

Reactive?

It causes a lot of bad reactions. That's why they had to switch from DPT to DTaP; because the old vaccine caused too much harm. But sadly, the new vaccine is no safer, and it's even less effective. There is conversation about switching back to DPT again!

Polio, flu, meningitis, Human Papiloma Virus... these all can cause the diseases they're meant to prevent. I have personally seen it happen. Especially whooping cough and flu. We get calls from people all the time who tell us that their child who got the DTaP, started coughing right away. Their infant caught the disease from a vaccinated child. This happens a lot. Flu? The amount of people who get the flu from the vaccine is just too many to count!

I'm amazed that they've kept up this charade for so long. But thankfully, a lot of people are starting to wake up. They're questioning, researching, and making their own educated decisions.

How could you question the Polio vaccine? It has saved millions of lives! Do you want to go back to the days of polio paralysis?

If polio dropped 50% between 1952 and 1955 do you credit the 1955 vaccine for that? That's when it was introduced. The polio story is really complicated. But I can tell you that the vaccine has done nothing to prevent childhood paralysis. Jonas Salk, polio vaccine developer, testified that the OPV caused most if not all cases of polio paralysis since the 1960's. How could the vaccine prevent a disease when it causes it? The polio vaccines continue to cause paralysis to this very day. They never prevented it. The book by Dr. Suzanne Humphries, called "Dissolving Illusions" is the most comprehensive treatment of the real history of infectious diseases. I recommend it to anyone who wants to know more on this subject.

When large groups stop vaccinating, there are outbreaks of vaccine-preventable diseases. Is that what you want? Don't you think society has benefited from prevention of these diseases?

Some diseases, like measles, mumps and rubella, chicken-pox may come back if people stopped vaccinating. I'm not even slightly afraid of these diseases. I know that they're not dangerous. I am afraid of the MMR vaccine. I would never risk my children's health by giving them a dangerous vaccine to prevent a mild disease.

The CDC says that the recent measles epidemic is due to the "anti-vaxxers". Aren't you risking your own children's health and public health by refusing vaccines?

The effectiveness of the MMR vaccine is wearing off. This has nothing to do with the "anti-vaxxers." Measles is a normal childhood disease. The vaccine kills more kids than the disease would. It causes a lot of brain damage too. I'd rather my kids have a rash and a fever for a week or two than brain damage. Any parent would, they just don't know the real risks of the vaccines and neither does their doctor.

Public health is in a real crisis right today. Kids are seriously sick: ear infections, eczema, diabetes, asthma, ADHD, epilepsy, anaphylactic allergies- like peanut allergy, autism, leukemia, SIDS... these problems are growing worse every year. Vaccines may not be the only cause, but they are probably the main cause. Most of these problems are listed as potential risks in vaccine package inserts.

Doctors like to say that everything is genetic, that these are inborn conditions. They're not. Unvaccinated kids have a tiny fraction of all these problems compared to vaccinated kids. Parents who've stopped vaccinating see a difference between their unvaccinated and their vaccinated children.

What about the Autism? They say it has always been around. They're just much better at diagnosing it now. Don't you think you're misleading the public by accusing vaccines of causing autism?

There was no such thing as autism until the 1940's when it was classified in the DSM as a new disease. Do you think people used to be dumb? The symptoms of autism are very strange- they could not have been missed. We're experiencing an epidemic. It's worse every year. We have gone from 1 case of autism in 10,000 in the 1970's, 1 in 2,500 in the 1990's, and currently the rate is up to 1 in 45. What will it take to wake people up? Do we have to wait until every other child is autistic before we realize something's wrong?

I can prove to you that autism is a new and growing problem, with a very simple

comparison: How many 50-year-olds are autistic? How many 5-year-olds are? It's not evenly distributed among all ages. The later you're born, the higher your chance of being autistic. There's no such thing as a genetic epidemic, so the cause has to be environmental. The evidence that vaccines have caused this epidemic is actually really obvious, since the autism population keeps rising as more vaccines are being mandated.

Aren't unvaccinated kids unfairly endangering the people around them?

Unvaccinated children or adults don't spread disease by default. It's quite absurd to imagine that just because they haven't been vaccinated, that somehow makes them highly contagious with every disease known to man.

On the other hand, recently vaccinated people can spread disease. The viruses can "shed." This has been documented to have happened with polio, MMR, whooping cough, and probably others as well. That's why recently vaccinated people aren't supposed to go near cancer patients. Vaccine manufacturers warn about this. Since vaccines actually cause harm to people who aren't sick, I don't even think they're halachically permissible. Aren't people who want to force vaccines on others actively endangering them?

But people are living longer than ever before today because of vaccines!

So my unvaccinated grandmother is B"H healthy at 90 years, because her granddaughter receives 10 vaccines at 90 days? Vaccination is not the reason for longevity.

Then what is the reason?

The real causes of longevity today are mainly improved living conditions, hygiene, sanitation and nutrition. Vaccines have taken undeserved credit.

But vaccines save lives!

I don't think the evidence supports that, at all. But even if we are to assume they did, can you take a life to save a life? Can you take one life to save many lives? I don't think so. There is no doubt that some will die as a result of vaccination. They call it "wastage." That's how they refer to human life. They know some will die, but they justify it, that the people who die are being sacrificed for public health. For the "greater good." How can we justify this? It's k'neged halachah.

If you don't vaccinate your kids, aren't you relying on others who've received vaccines to protect your kids from contagious diseases?

Not at all. As I explained, vaccinated children can spread disease. This doesn't happen every day, but it happens. Of course unvaccinated kids can also spread disease – diseases they've been exposed to, but, I would never want other people's kids to act as a human shield to protect my own! Everyone should do what's best for their own child. No one should be risking his child's health to protect mine. I would never want them to. Besides which, the protection is illusory.

What about herd immunity?

What's your definition of herd immunity?

Well, if enough people are immune to a disease, it won't spread. As long as the majority has antibodies, the disease can't spread.

That is basically what they say. But is it reality? Herd immunity was a hypothesis originally based on the observation of cattle. Herds. They noticed that after most of a herd caught a certain disease, that disease disappeared from the herd, even the ones who didn't catch the disease were protected.

I'll tell you what was really going on. In reality, all the animals were exposed. Some had symptoms, some didn't. They didn't do antibody tests in those days- it was the 1700's. But each animal was immune because their own immune system remembered the infection. The herd could do nothing to protect an animal without antibodies.

That's why even today they haven't been able to achieve herd immunity. They would have to make a population 100% immune to the disease. Everybody. Vaccines can't do that, because not everybody becomes immune to a disease after vaccination. Even positive antibody titers don't necessarily prove that you're immune. Some people with high titers can still catch the disease. And some people never develop antibodies in the first place. Scientists today still don't fully understand the immune system. A lot remains unknown. My point though is that herd immunity is not really possible. If you're not immune, "the herd" of people who are immune won't protect you from catching a disease. That's not how it works for cows or people.

So how have they eradicated diseases? Didn't they do that through vaccination and herd immunity?

No. Smallpox was eradicated through quarantine (isolating sick individuals). That's what the World Health Organization admits. Diphtheria declined at the same rates in countries that didn't vaccinate as countries that did. Improved

living conditions eradicated diphtheria. No disease has ever been eradicated through vaccination. How could it be? You expose everybody to a disease and then it disappears? Vaccine immunity wears off eventually and then the disease can come right back.

Also, polio never really disappeared. They just changed the name. Now they call it acute flaccid paralysis, or transverse myelitis... There are more disabled children today than there were in the 1950's during the worst polio epidemics. We just don't see reality for what it is. They tell us they eradicated polio, and we believe it.

So you think schools don't have the right to kick out unvaccinated kids?

There is no legal reason for schools to bar unvaccinated kids. Religious exemptions are legal in 47 states. In almost every case that parents took the school to court, the court sided with the parents, that they have the right to send their kids to school with a religious exemption.

Will parents of unvaccinated kids take responsibility if their child catches or spreads a contagious disease?

Do schools bar recently vaccinated kids that shed disease for several weeks? There is no reason to fear unvaccinated kids! It's baseless. In the case where someone catches a disease naturally, I think that the Ribono Shel Olam can take responsibility. But for a man-made vaccine-induced injury? That, I think man has to take the blame for.

What has happened to our emunah? Instead of fearing Hashem, we fear meningitis! (By the way, the real source of the epidemic-levels of meningitis today is vaccines, like DTaP and MMR.)

The best kept secret is that kicking kids out of school because of vaccines is k'neged halacha. Rav Chaim Kanievsky shlita, said that if you are afraid of unvaccinated children at school, then you should keep your vaccinated children home. His psak halachah has been ignored by too many schools and his letters have been boycotted by the frum media.

*A lie can run
halfway across
the world while
the truth is tying
its shoes.*

☞ The National Vaccine Compensation Program has awarded over \$3 billion in damages to children and adults injured by vaccines.

☞ Unusual high-pitched crying after vaccination is often a sign of brain inflammation.

☞ The DTap vaccine package insert lists both SIDS and Autism as adverse reactions, and that 70% of SIDS deaths occur within 3 weeks after the vaccine. (see package insert below)

☞ "A single vaccine given to a six pound newborn is equivalent to giving a 180-pound adult 30

vaccinations on the same day!" (Dr. Boyd Haley, Professor and chair, Dept. of Chemistry, University of Kentucky, 2001)

☞ After vaccine recommendations were accelerated in 1991, Autism rates in the US went up from roughly 1 in 2,500 to at least 1 - 45 today.

☞ The CDC admits that no long-term studies were ever done on vaccines.

☞ Vaccines contain Carcinogens (known to cause cancer) such as Formaldehyde and Polysorbate80 and childhood cancers are continuously climbing.

Dr. Viera Scheibner, PhD and fellow SIDS researchers developed an advanced infant breathing monitor to determine the risks factors for SIDS. They found that breathing suppression and cessation were occurring predictably at 2, 4, and 6 months of age, and discovered that the common causative factor was the DPT shot, given at those times.

They observed that vaccination was the single greatest cause of stress in small babies and the single greatest factor preceding infant death in a large number of cases.

"Vaccination is the single most prevalent and most preventable cause of infant death."

-Dr. Viera Scheibner,
author of "Vaccination: 100
Years of Orthodox Research"

DTaP Package Insert

268, 376
Toxoids and Acellular
Pertussis Vaccine Adsorbed
Tripedia®

Rx only

DESCRIPTION

Tripedia®, Diphtheria and Tetanus Toxoids and Acellular Pertussis Vaccine Adsorbed (DTaP), for intramuscular use, is a sterile preparation of diphtheria and tetanus toxoids adsorbed, with acellular pertussis vaccine in an isotonic sodium chloride solution containing sodium phosphate to control pH. After shaking, the vaccine is a homogeneous white suspension. Tripedia vaccine is distributed by Sanofi Pasteur Inc.

Additional Adverse Reactions:

- As with other aluminum-containing vaccines, a nodule may be palpable at the injection sites for several weeks. Sterile abscess formation at the site of injection has been reported.^{1,3,4}
- Rarely, an anaphylactic reaction (ie, hives, swelling of the mouth, difficulty breathing, hypotension, or shock) has been reported after receiving preparations containing diphtheria, tetanus, and/or pertussis antigens.³
- Arthus-type hypersensitivity reactions, characterized by severe local reactions (generally starting 2-8 hours after an injection), may follow receipt of tetanus toxoid.
- A few cases of peripheral mononeuropathy and of cranial mononeuropathy have been reported following tetanus toxoid administration, although available evidence is inadequate to accept or reject a causal relation.¹⁷
- A review by the Institute of Medicine (IOM) found evidence for a causal relationship between tetanus toxoid and both brachial neuritis and Guillain-Barre syndrome.¹⁷
- A few cases of demyelinating diseases of the CNS have been reported following some tetanus toxoid-containing vaccines or tetanus and diphtheria toxoid-containing vaccines, although the IOM concluded that the evidence was inadequate to accept or reject a causal relationship.¹⁷

Adverse events reported during post-approval use of Tripedia vaccine include idiopathic thrombocytopenic purpura, SIDS, anaphylactic reaction, cellulitis, autism, convulsion/grand mal convulsion, encephalopathy, hypotonia, neuropathy, somnolence and apnea. Events were included in this list because of the seriousness or frequency of reporting. Because these events are reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequencies or to establish a causal relationship to components of Tripedia vaccine.²

Reporting of Adverse Events

The National Vaccine Injury Compensation Program, established by the National Childhood Vaccine Injury Act of 1986, requires physicians and other health-care providers who administer vaccines to maintain permanent vaccination records of the manufacturer and lot number of the vaccine administered in the vaccine recipient's permanent medical record along with the date of administration of the vaccine and the name, address and title of the person administering the vaccine. The Act (or statute) further requires the health-care professional to report to the Secretary of the US Department of Health and Human Services, the occurrence following immunization of any events set forth in the statute or the Vaccine Injury Table, including anaphylaxis or anaphylactic shock within 7 days; encephalopathy or encephalitis within 7 days; brachial neuritis within 28 days; or an acute complication or sequelae (including death) of an illness, disability, injury, or condition referred to above, or any events that would contraindicate further doses of vaccine, according to this Tripedia vaccine package insert.^{18,19}

Testimonials As Told To The Peach Support Network

On August 11, 1997, my eighth child was born. Two months later, I took him for a well visit where he was vaccinated for Polio, DPT, and I don't know what else. He developed a fever, cried for a few days, and developed a strangelooking rash. He slept a lot and was very lethargic. It was hard to wake him up. He would take five hour naps during the day, which he had never done before. It took several weeks for the rash to go away and for him to appear a little less sick. At eight months, he was just starting to turn over.

At nine months, I took him to the doctor, who vaccinated him for the second time. After the shots, he screamed inconsolably for a few days and was very stiff. It was very hard to wake him. I later found out that this was a not-so-rare symptom of vaccine-induced encephalitis (brain inflammation). He also developed hemiplegia and could barely use his left hand and foot. After this, he didn't turn over independently for another two years. He was diagnosed with microcephaly.

I was told that the injection in his left arm had affected the function of his arm and leg. With years of intensive therapy, he regained function on his left side and started to walk independently by age 7½. At ten years old, he still needs full personal care and is globally delayed. It is clear to me that had he not been vaccinated, he would not have the disabilities he now suffers from.

-Mrs. B. (Lakewood)

At her twelve-month well-baby visit, my daughter was developmentally advanced for her age, and she was already saying quite a few words. She received her round of vaccinations (including the MMR). Right afterward she developed a high fever and we witnessed a change in behavior. In the following weeks, I brought her to the doctor quite a few times; the reactions were severe and I was very worried. The doctor told me that this kind of reaction could occur as the result of the vaccine, but that it was only temporary, nothing to worry about.

Three months later, the doctor wanted to administer another round of vaccines. I was very concerned, due to the strong reaction my daughter exhibited the previous time, but the doctor told me I was being foolish and that it is very dangerous not to receive the vaccines. I gave in and let him vaccinate her again. This time, her speech and intellectual development stopped and regressed, to the point that she was diagnosed with autism a few weeks later.

The regression clearly started after the vaccines, but the doctor nonetheless denied the connection. Since then, I have refused to continue to vaccinate my daughter. I don't care what they say, I saw with my own eyes how the vaccines caused her to become autistic.

-Mrs. K. (Lakewood)

Chaya tucked the blanket around little Miriam's chubby legs and fastened the car seat straps. Her beautiful six-month-old grinned at her and Chaya gave her one more peck on the cheek before sliding into the driver's seat and heading towards the doctor's office. It was time for Miriam's six-month well baby visit. After receiving the DTaP vaccine Miriam gave a jerk, and seemed to go into shock for a moment.

On the way home from the doctor, Miriam was inconsolable. She cried and cried for the rest of the day. That night, Miriam would not fall asleep, and screamed nonstop through the night, and the next few days.

Friday night, three days after the vaccine, she seemed to calm down, and in the morning, a relieved Chaya waited for Miriam to wake up. After some time Chaya decided to check up on her baby. She picked up Miriam, who did not look like herself at all, and let out a horrifying scream.

Miriam didn't make it through the night.

Common Adverse Vaccine Reactions (compiled from vaccine package inserts)

DTaP

local reactions (pain, redness, bruising, swelling, cellulitis, abscess at injection site), allergic/anaphylactic reaction, angioedema, apnea, autism, body ache, brachial neuritis, bronchitis, chills, cough, convulsions (including febrile and grand mal), cyanosis, diarrhea, drowsiness, ear pain, encephalopathy, extensive swelling of the injected limb, facial palsy, fatigue, Guillain-Barré Syndrome, headache, high fever, hypersensitivity, hypotonia, irritability, muscle weakness or spasms, myelitis (swelling of the spinal cord), myocarditis, myositis, nausea, nerve compression, paraesthesia, persistent crying, pruritus, rash, respiratory tract infection, screaming, seizures, sensory disorder, sore and swollen joints, sleepiness, swollen lymph nodes, syncope (loss of consciousness), thrombocytopenia, tiredness, unilateral facial paralysis, urticaria, vomiting, Sudden Infant Death Syndrome

Influenza

local reactions (cellulitis, pain, mass, inflammation, ecchymosis, swelling, hemorrhage, hardening, itchiness), abdominal pain, anaphylactic shock, chills, chest tightness, death, diarrhea, difficulty breathing, facial edema, fatigue/weakness, fever, hot flashes/flushes, joint pain, malaise, muscle and joint weakness/pain, nausea, nervous system disorders (including headache, dizziness, neuralgia, paraesthesia, confusion, febrile convulsions, Guillain-Barré Syndrome, myelitis, neuritis, paralysis, Bell's Palsy), sore throat, Stevens-Johnson Syndrome, sweating, swollen lymph nodes, syncope, thrombocytopenia, vasculitis, vomiting, wheezing

Hepatitis B

local reactions (itchiness, ecchymosis, swelling, warmth, and nodule formation, pain, tenderness, redness, swelling at injection site), abdominal pain (including cramps), constipation, diarrhea, nausea, vomiting, achiness, agitation, alopecia, anaphylaxis, anorexia, angioedema, arthritis, Bell's Palsy, bronchial spasm, chills, constipation, cough, diarrhea, dyspepsia, dyspnea, dysuria, ecchymoses, edema, elevation of liver enzymes, encephalitis, erythema multiforme, erythema nodosum, eczema, fatigue/weakness, febrile seizure, flushing, Guillain-Barré Syndrome, headache, herpes zoster, high fever, hypesthesia, influenza, insomnia/disturbed sleep, irritability, joint disorders, lightheadedness, lupus, malaise, meningitis, migraine, multiple sclerosis, myalgia, myelitis, nausea, neck stiffness, pain (including back, neck, shoulder), op-

ic neuritis (including conjunctivitis, visual disturbances, and uveitis) palpitation, paresthesia, peripheral neuropathy, persistent crying, petechiae, pharyngitis, pruritus, radiculopathy, seizure, sleepiness, Stevens-Johnson Syndrome, sweating, swollen lymph nodes, syncope, tachycardia, tinnitus, thrombocytopenia, upper respiratory infection, urticaria, vasculitis (including polyarteritis nodosa), vertigo/dizziness, vomiting

IPV (Polio)

local reactions (mass, pain, rash, redness, swelling at injection site), agitation, allergic reaction, anaphylactic reaction, anaphylactic shock, anorexia, convulsions and febrile convulsion, drowsiness, Guillain-Barré Syndrome, headache, high fever, irritability, joint pain, myalgia (muscle pain), paresthesia, persistent crying, sleepiness, swollen lymph nodes, tiredness, urticaria, vomiting

HIB

local reactions (pain, redness, swelling at injection site), allergic reactions, anaphylaxis, angioedema, anorexia, convulsions, drowsiness, extensive limb swelling, high fever, irritability, pruritus (itchiness), peripheral edema, persistent crying, urticaria, vomiting

Pneumococcal

local reaction (cellulitis, pain, itchiness, redness, soreness, swelling/hardening of injection site), anaphylactoid reactions, angioneurotic edema, arthritis, back pain, chills, decreased limb mobility, diarrhea, dyspepsia, ecchymosis, erythema multiforme, febrile convulsion, fever, Guillain-Barré Syndrome, headache, hemolytic anemia, joint pain, leukocytosis, malaise, myalgia, nausea, neck pain, paresthesia, pharyngitis, radiculoneuropathy, rash, serum sickness, swelling of injected limb, swollen lymph nodes, thrombocytopenia, upper respiratory infection, urticaria, vomiting, weakness/fatigue

Rotavirus

cough/runny nose, diarrhea, fever, fussiness/irritability, gastroenteritis, hematochezia, idiopathic thrombocytopenic purpura, Kawasaki disease, loss of appetite, maladministration, recurrent intussusception (including death), vomiting

Meningococcal

apnea, arthralgia (joint pain), balance disorder, bone pain, change in eating habits, chills, diarrhea, dizziness, ear pain, elevation of liver enzymes, eyelid ptosis (drooping eyelid), facial nerve paralysis, fatigue, fever, Guillain-Barré Syndrome, headache, hearing impairment, hypersensitivity, irritability, malaise, myalgia, nausea, oropharyngeal pain, persistent crying, rash, seizure, skin exfoliation, sleepiness, syncope, vertigo, vestibular disorder, vomiting

MMR

local reaction (blistering, burning/stinging, hardening, itchiness, redness, swelling, tenderness of injection site), anaphylaxis, arthritis, joint pain, ataxia (lack of muscle coordination which may affect speech, eye movements, ability to swallow, walking, picking up objects), atypical measles, bronchial spasm, cough, death, diabetes (type 1), diarrhea, dizziness, ear infection, ear nerve deafness, encephalitis, eye retinitis, febrile convulsions, fever, Guillain-Barré Syndrome, headache, irritability, leukocytosis, malaise, measles, mumps (including epididymitis, orchitis, parotitis), severe skin reactions, myalgia, nausea, ocular palsies, optic neuritis (including conjunctivitis, papillitis, and retrobulbar neuritis), pancreatitis, peripheral or facial edema, pneumonia, polyneuritis, rhinitis, seizures, sore throat, Subacute Sclerosing Panencephalitis (SSPE), swollen lymph nodes, syncope, thrombocytopenia, vasculitis, vomiting

Chicken-Pox (Varicella)

local reaction (redness, hematoma, hardening, numbness, itchiness, pyrexia, rash, soreness, swelling, of injection site), anaphylaxis (including anaphylactic shock), angioneurotic edema, aplastic anemia, aseptic meningitis, ataxia, Bell's Palsy, cellulitis, cerebrovascular accident, dizziness, encephalitis, erythema multiforme, facial edema, Guillain-Barré Syndrome, Henoch-Schönlein Purpura, herpes zoster, impetigo, necrotizing retinitis, non-febrile seizures, paresthesia, peripheral edema, pneumonia/pneumonitis, Stevens-Johnson Syndrome, thrombocytopenia, transverse myelitis, varicella (vaccine strain)

HPV (Gardasil)

local reactions (pain, redness, swelling at injection site), acute disseminated encephalomyelitis, alopecia, anaphylactic/anaphylactoid reactions, ankylosing spondylitis (inflammatory disease of the spine), autoimmune diseases (including hemolytic anemia, thrombocytopenia, thyroiditis), arthritis, abdominal pain, bronchospasm, blood clots, brain inflammation, celiac disease, cellulitis, chills, cough, death, deep venous thrombosis, diabetes mellitus insulin-dependent, diarrhea, dizziness, disabling fatigue, erythema nodosum (inflammatory condition), facial paralysis, fever, Guillain-Barré Syndrome, headache, heart problems, hyperthyroidism, hypothyroidism, inflammatory bowel disease, insomnia, joint pain, lupus, multiple sclerosis, malaise, motor neuron disease, myalgia (muscle pain and weakness), myocarditis (inflammation of the heart), nausea, nephritis (kidney disease),

בס"ד

ה' מר חשון תשע"ה

To the Board Members of the Bais Yaakov Of Baltimore

It would be inordinate for me to reiterate the דעת תורה spelled forth in the letter signed by HaRav Shmuel Kamentzky, HaRav Malkiel Kotler, HaRav Elyah Ber Wachtfogel, HaRav Shmuel Meir Katz, HaRav Binyamin Zev Halpern, and HaRav Eliezer Dunner Shlita, Rather, I will elaborate on one point and clarify it further:

The argument in favor of enforcing vaccination on all pupils is to guarantee the safety of all students. In reality, the medical establishment concedes that, unless there is an outbreak of a 'preventable' disease in town, the risk posed by the unvaccinated children is negligible. As a result, the Gedolim have ruled that, within the limits of the law, schools are not responsible for ensuring that all pupils are vaccinated. To further clarify this, should some children in a school get mumps, measles, etc, even if it would be traced back to an unvaccinated child, the school principal and members of the board would not be held accountable by Hashem. However, should a school obligate parents to vaccinate their children in order to accept them, the school principal and board members would be held accountable for anything that may result from such vaccination, whether as 'benign' as an allergy or as severe as a cardiac arrest.

This is what happened in Cleveland this past summer. Basya Rivka Berkovich, a healthy 12-year old girl, received the DPT and Pneumococcal vaccine on July 28th, 2014. Within three hours she developed fever, and her condition deteriorated from day to day. Her organs started failing and she was hospitalized, but was נפטר three weeks later. If vaccination was forced upon her by the school's board members, they will be accountable in בית דין של מעלה for רציחה, no less.

Unfortunately, reactions to vaccines do happen, some are hidden, some are benign, and some are more severe. And although the medical establishment claims that only a few adverse effects have been proven to be related to vaccines, Hashem who knows the reality will hold the responsible parties accountable even for what is yet unrecognized by science (יעוין בביאורי אגדות להגר"א ב"ק ט., ואבן שלמה פ"ד אות ז). Although many people do not view the moral responsibilities of a school this way, we know that Vaccines are not דעת בעלי בתים היפך מדעת תורה (סמ"ע חו"מ סי' ד' סק"ג בשם מהר"י ווייל) 100% effective, which is why vaccinated children sometimes contract those diseases and can carry their germs. In other words, vaccines are only a form of השתדלות. Ultimately, it is Hashem's protection that guarantees the safety and health of our children. It is only by acting according to His will - not the medical doctors - that a school and its students can be worthy of his protection.

יום א' לסדר ושמרת לעשות ככל אשר יודיק, ר"ח אלול תשע"ה.

לכבוד המנהלים החשובים

של החדרים ובתי יעקב שבעיר התורה לדליקוואוד יצ"ו.

In light of the recent attempt by some individuals that children who have not received the standard vaccines should not be accepted into school, we would like to state the following:

- As שומרי תורה ומצוות, Menahalim must keep in mind that denying a child acceptance to school and forcing parents to vaccinate their children against their will are decisions involving serious Halachic שאלות.
- Vaccination practices involve risks recognized by the medical establishment. In fact, In February 2011 the Supreme Court stated that vaccines are "unavoidably unsafe". Consequently, halachically no one has the right to force someone to vaccinate his children against his will.
- Setting school policy on this matter understandably necessitates medical knowledge of the מציאות and the risks involved. However it also requires much דעת תורה וכי' regarding חייב בטחון, השתדלות, וכי' all topics for which doctors are not qualified to rule upon.

Recently, in a letter addressed to Hagaon Rav Chaim Kanievsky, Dr Shanik explained the reasons a school should not accept non-vaccinated children. Yet, after weighing all considerations, Rav Chaim Shlita paskened explicitly that schools cannot refuse such children. This psak has been endorsed by many Gedolim and Poskim (see enclosed letters): As שומרי תורה who rule our lives according to דעת תורה it would be nothing short of בזיון התורה and חילול ה' if the frum schools of Lakewood would disregard this psak.

May the זכות of conducting ourselves according to דעת תורה be a true protection for our children and bring lasting health to all the members of our community.

בס"ד
כ"ט תשרי תשע"ה

To whom it may concern,

The Torah commands, דברים ד, טו ונשמרתם מאד לנפשותיכם. This Biblical commandment requires one to be very vigilant in caring for one's life, and refrain from any action that may put his life or health in danger. The benefits and risks of vaccination is a much debated topic in medical and scientific circles. Although one may follow the opinion of most doctors and choose to vaccinate his children, the individual who has done his research has the obligation to act according to his knowledge. If his research has led him to understand that the risks of vaccination are greater than its benefits, and particularly when his view is supported by many medical doctors and researchers, the commandment of לנפשותיכם מאד ונשמרתם obligates him to shield his children from vaccines. This is even more so when a parent has reasons to believe that his children are sensitive to vaccines. To act otherwise would be a transgression of the above Biblical commandment.

Schools must honor the request for religious exemption from such parents, for it is entirely justified. Coercing parents to vaccinate against their will under the claim of protecting the public is a display of lack of בטחון, for the risk that the unvaccinated children are posing to the public is statistically so small that it is not the duty of a מאמין בה' to worry about it (see the letter of Rav Chaim Kanievsky Shlita.) The medical establishment, too, is of the opinion that this risk is insignificant. This is the reason why schools are obligated by law to accept religious exemptions as long as there is no outbreak of preventable disease. Additionally, anyone coercing someone to vaccinate against his better judgement becomes responsible before Hashem for any adverse reaction - big or small - that could result from it, ח"ו.
